

- help me

Examples/Usage

- Enclose code snippets using `<Code>` and `</Code>` tag to show it *pretty-printed* in wiki page.
- Prettify module makes a best effort to guess the language but works best with C-like and HTML-like languages.
- To specify language hint for Prettify, you can use
 1. `<Code:ext>` (file extension, you must put it just after «Code:» keyword)
 2. `<Code lang-ext>` option
- For example, use `<Code:css>` or `<Code lang-css>` to specify that the code is Cascading Style Sheets (CSS).
- use `linenums` or `noLINenums` option to turn on/off line numbering. You can add a colon and the number to the end of the option, eg. `linenums:12` to specify start line number.
- If you want to add title for code block, you can specify it after `|` that will be shown just above the code box.

```
<Code:php linenums:1 |Example #1 Our first PHP script: //hello.php//>
<html>
  <head>
    <title>PHP Test</title>
  </head>
  <body>
    <?php echo '<p>Hello World</p>'; ?>
  </body>
</html>
</Code>
```

Example #1 Our first PHP script: *hello.php*

```
1. <html>
2.   <head>
3.     <title>PHP Test</title>
4.   </head>
5.   <body>
6.     <?php echo '<p>Hello World</p>'; ?>
7.   </body>
8. </html>
```
