ACTION_ACT_PREPROCESS

dataentry event

Description:	Handling ?do= actions
DefaultAction:	Dokuwiki's own processing of the $ACT value
Preventable:	yes
Added_dt:	2006-04-25

This event allows you to catch any action mode passed to the DokuWiki dispatcher act_dispatch() in inc/actions.php before it begins to process the $ACT variable itself.

The AFTER action is never performed on a successful `save`.

Passed Data

The passed Doku_Event has the field `$data`.

`$data` is a string or array containing the $ACT value (the `do` variable in the query string - uncleaned). See act_clean() for an example of cleaning.

Add a BEFORE event handler to process your action. Check the `$data` field for the correct action name. Also use an unique action name to avoid collisions.

Use `preventDefault()` to skip DokuWiki's processing of the action. `$data` is a reference to the $ACT variable, so assigning another action string to the `$data` field will be noticed outside your event handler.

The AFTER event handler lets you handle actions after performing DokuWiki's default action handling (attention: can be eventually skipped by `preventDefault()`). Due to handling of actions by plugins and DokuWiki itself the AFTER event handler can be reached with another action than you expect at first sight. Please be aware it.
